2 ///////////////////////////////////////////////////////////////////
3 // TEMPLATE CLASS PROVIDED: sequence<T> (a container class for a list of items,
4 //      where each list may have a designated item called
5 //      the current item)
6 //
7 // TYPEDEFS and MEMBER FA2019 for the sequence<T> template class:
8 //     typedef ____ value_type
9 //     sequence<T>::value_type is the T data type from the template parameter.
10 //     It is the data type of the items in the sequence.
11 //     It may be any of the C++ built-in types (int, char, etc.), or a
12 //     class with a default constructor, an assignment operator, and a
13 //     copy constructor.
14 //     typedef ____ size_type
15 //     sequence<T>::size_type is the data type of any variable that keeps
16 //     track of how many items of type T are in a sequence.
17 //     static const size_type CAPACITY = ____
18 //     sequence<T>::CAPACITY is the maximum number of items T that a
19 //     sequence can hold.
20 //
21 // CONSTRUCTOR for the sequence<T> class:
22 //     sequence()
23 //     Pre: (none)
24 //     Post: The sequence has been initialized as an empty sequence.
25 //
26 // MODIFICATION MEMBER FUNCTIONS for the sequence<T> class:
27 //     void start()
28 //     Pre: (none)
29 //     Post: The first item on the sequence becomes the current item
30 //           (but if the sequence is empty, then there is no current item).
31 //     void end()
32 //     Pre: (none)
33 //     Post: The last item on the sequence becomes the current item
34 //           (but if the sequence is empty, then there is no current item).
35 //     void advance()
36 //     Pre: is_item() returns true.
37 //     Post: If the current item was the last item in the sequence, then
38 //           there is no longer any current item. Otherwise, the new current
39 //           item is the item immediately after the original current item.
40 //     void move_back()
41 //     Pre: is_item() returns true.
42 //     Post: If the current item was the first item in the sequence, then
43 //           there is no longer any current item. Otherwise, the new current
44 //           item is the item immediately before the original current item.
45 //     void add(const value_type& entry)
46 //     Pre: size() < CAPACITY.
47 //     Post: A new copy of entry has been inserted in the sequence after
48 //           the current item. If there was no current item, then the new
49 //           entry has been inserted as new first item of the sequence. In
50 //           either case, the newly added item is now the current item of
51 //           the sequence.
52 //     void remove_current()
53 //     Pre: is_item() returns true.
54 //     Post: The current item has been removed from the sequence, and
55 //           the item after this (if there is one) is now the new current
56 //           item. If the current item was already the last item in the
57 //           sequence, then there is no longer any current item.
58 //
59 // CONSTANT MEMBER FUNCTIONS for the sequence<T> class:
60 //     size_type size() const
61 //     Pre: (none)
62 //     Post: The return value is the number of items in the sequence.
63 //     bool is_item() const
64 //     Pre: (none)
65 //     Post: A true return value indicates that there is a valid
66 //           "current" item that may be retrieved by activating the current
67 //           member function (listed below). A false return value indicates
68 //           that there is no valid current item.
69 //     value_type current() const

```

```

70 //      Pre: is_item() returns true.
71 //      Post: The item returned is the current item in the sequence.
72 // VALUE SEMANTICS for the sequence<T> class:
73 //      Assignments and the copy constructor may be used with sequence
74 //      objects.
